ElderCareAI Program and Administrator Workflows

These flows describe the current phone, watch and administrator portal. The accompanying editable Mermaid files contain the diagrams. Yes and No branches below define the major decisions and their next steps.

Program workflow

Step	Decision or action	Yes path	No path
1	Caregiver sign in succeeds	Check setup and patient profile.	Show error and retry sign in.
2	Caregiver and patient setup complete	Check watch pairing.	Resume missing setup forms.
3	Galaxy Watch6 paired and permissions granted	Start watch monitoring.	Pair or repair connection and permissions.
4	Monitoring active and internet available	Upload watch vitals and location to Supabase.	Show waiting or offline status; retry on connection.
5	A valid new watch reading or position arrives	Update cards, history, analytics and map.	Keep last timed reading visible as stale or waiting.
6	An app alert rule crosses a threshold	Save alert, show in app, and route push when configured.	Continue monitoring without a threshold alert.
7	Health history has new sleep or overnight oxygen	Import recorded history to the selected patient.	Keep existing history; show no new data.
8	Watch position is fresh and reliable enough for safe-zone review	Check distance from the saved home center.	Show uncertain location and wait for a better fix.
9	Watch leaves the safe zone after accuracy checks	Save a location alert and notify the caregiver.	Continue showing position on the map.
10	Medication or appointment reminder is due	Show each unique reminder and record delivery.	Keep the next scheduled item in the care plan.
11	Caregiver chooses a care action	Open medications, appointments, notes or timeline.	Use health analytics, Elle or location screens.
12	Prescription image extracted and caregiver confirms	Save corrected medication and schedule.	Keep editable draft; no medication is activated.
13	SOS confirmed	Save emergency event and show priority contacts.	Return to monitoring without creating SOS.
14	Continue monitoring	Repeat upload and review cycle.	Stop watch monitoring and sign out when finished.

Medication and appointment reminders carry separate event identities. If two occur together while the app is open, their popups appear in sequence. Closed-app push requires a registered phone, notification permission and internet connectivity.

Administrator workflow

Step	Decision or action	Yes path	No path
1	Administrator sign in succeeds	Verify admin role and active status.	Show sign-in error and retry.
2	Administrator access allowed	Open Overview dashboard.	Deny access; keep the admin portal closed.
3	Account task selected	Review caregiver and linked patient records.	Choose monitor, alerts, reports or security.
4	Account edit or status change confirmed	Save change and refresh list.	Cancel without changing records.
5	Permanent deletion confirmed by typed name	Delete selected record and linked data.	Leave record in place.
6	Monitoring or alerts task selected	Review device status, sync age, alerts and audit activity.	Continue to reports or security.
7	Report filters valid and rows exist	Export requested CSV for selected dates.	Adjust filters or show no-data result.
8	Admin security action confirmed	Update other admin access and review audit.	Return to security view unchanged.
9	Another task remains	Return to Overview or choose another section.	Sign out and end admin session.

The portal currently exposes Overview, Manage accounts, System monitor, Alerts and notifications, Generate reports, and Manage security. Account deletion and admin access changes require explicit confirmation in the portal.
